

Regional Evaporation
-as-a-Service Hubs:

A Reliable Outlet for Your Wastewater

A new regional solution for guaranteed, cost-effective wastewater treatment and disposal.

The network is shrinking

Costs are rising

Options are disappearing

For years, landfill leachate and industrial wastewater have been trucked to local treatment plants.

But that model is breaking down.

Municipal WWTPs are rejecting high-strength waste due to PFAS, TDS, ammonia and other contaminants.

Deep-well injection and long-haul trucking are becoming prohibitively expensive.

And new regulations are closing off the last remaining outlets.

For operators, the message is clear:

The days of
“business as usual”
disposal are over

Redefining Wastewater Disposal for a Changing World

Regional Evaporation-as-a-Service Hubs built and operated by Heartland.

Heartland is building a network of EaaS Hubs across North America - facilities designed to treat:

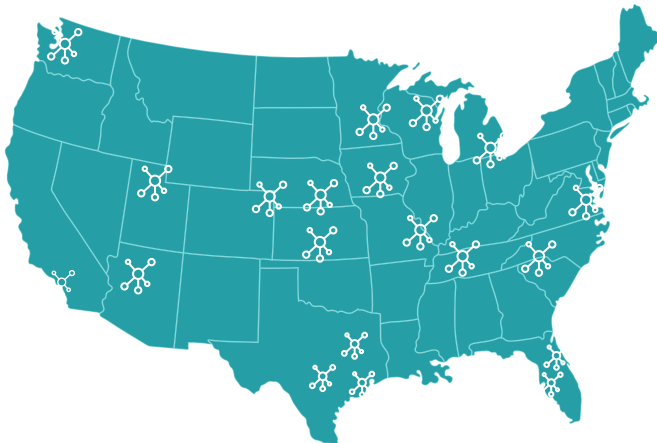

- Leachate
- Produced water
- RO brines
- High TDS wastewaters

Each Hub uses Heartland's proven **Concentrator** technology — a low-temperature, direct-contact evaporator that safely and efficiently reduces wastewater volume by more than **90%**.

Wastewater producers simply **deliver their leachate** to a nearby Hub and **pay a disposal fee** — no permitting, no upfront capital expense.

Mitigate Risk. Reduce Liability. Protect Your Brand.

Every load of wastewater carries potential liability — from PFAS exposure and tightening discharge limits to public perception and regulatory enforcement. Heartland eliminates that uncertainty. Our EaaS Hubs provide full-chain documentation, regulatory compliance, and a guaranteed outlet that shields you from treatment, permitting, and disposal risk.

Why wastewater producers choose Heartland EaaS Hubs

Certainty: Guaranteed outlet for your wastewater, regardless of WWTP restrictions or regulatory changes.

Savings: Avoid rising disposal and trucking costs by accessing a regional, high-capacity facility.

Simplicity: No need to install or operate treatment equipment — just deliver and go.

Compliance: Stay ahead of tightening PFAS and TDS regulations with a proven, thermally driven solution.

Scalability: Each EaaS Hub serves multiple customers and can expand to meet regional demand.

Already Proven. Already Operating.

Heartland systems have treated over **1.5 billion gallons** of tough industrial wastewater — including landfill leachate, FGD water, and other high-TDS streams — across more than **20 installations nationwide.**

Secure your disposal certainty today.

Heartland is actively sourcing feedstock for its next generation of EaaS Hubs.

If you generate landfill leachate, contact water, or other high-TDS wastewater, we want to hear from you.
